Background Information

1) According to the Sullivan family, John J. Sullivan was a male, Caucasian, 32 years of age at the time of his disappearance in San Salvador on December 16, 1980. He is/was approx. 5' 11" - 6' and weighed approximately 185 lbs., wore a full beard and had a brownish-blonde hair cut.

2) The family indicated that he was clothed with an eight wale corduroy [illegible] the [illegible], a [illegible] shirt, [illegible] and a pair of tan fabric shoes. [illegible]

3) Select Main Service, from the Section of the [illegible] as cut [illegible] the family.

4) Photographs and reports associated with the case of John Sullivan was supplied by Alex Peltier, Chief Welfare Whereabouts Division, Citizens Emergency Center, United States Department of State. Included documents from Dr. Mario Esquivel, a Radiologist, Armondo Agusto Palma, Justice of the Peace, Manuel Beltran Hernandez, Clerk of the Justice of the Peace, and Dr. Roberto Masferrer. These letters from each individual were written both in English and Spanish.

5) Consular Mortuary certificate from Fernando Beltran, Counsel of the United States of America with all certification from the Second Judge of the first instance of Nueva San Salvador, El Salvador, reporting the finding of the body and a letter from the Second Judge of the first instance of Nueva San Salvador, delivering the remains to the Embassy for shipment to and examination in the United States.

Arrival of Societal Remains (February 26, 1983)

The cargo designated as "Human Remains" arrived at 12:11 a.m. at Newark International Airport via Eastern Airlines from Miami and arrived at the cargo area of Eastern at 12:50 a.m. James T. Costello, Senior Medical Investigator of the Rockland County Medical Examiner's Office, picked up the parcel at that time via van. Also present at the airport were Donna and John Igoe and Debbie and Joseph Inerieri, the sisters and brothers-in-law of John J. Sullivan, and Jamie Fox and Pat Esposito, representatives of Congressman Robert J. Torricelli's Office.

The remains were contained in a dark royal blue canvas bag sewn on both ends with a blue mattress stitch. The bag was addressed in large yellow letters:

TO: DR. FREDERICK T. DUGLEE
OFFICE OF THE MEDICAL EXAMINER
ROCKLAND COUNTY HEALTH COMPLEX
POMONA, NEW YORK 10970

TEL. 914-354-0201
914-354-1333

The package bore an orange-red express label with origin code 20C MIA 12625814 Final Destination EWR Total weight 71. Mrs. Donna Igoe placed a red ribbon containing two yellow and one white chrysanthemums on one side of the package. The package was transported to the Medical Examiner's Office in Pomona, New York.

Forensic Anthropology Report

On February 5th and 6th, 1981 the following remains, classified by the Office of the Chief Medical Examiner of Baltimore County as Case No. 81-8, were received from Dr. Frederick T. Zugibe, Chief Medical Examiner, Howard County, for a complete anthropological assessment and identification of the partial skeleton.

[illegible] the left [illegible] are present. Also present are the right clavicle, scapula and the upper third of the right upper limb. The left clavicle, the sternum, the sternal end of the right clavicle, the first three thoracic vertebrae and the upper third of the left humerus are missing. The left upper limb preserves only the proximal end of the humerus to a level slightly below the surgical neck. Some of the cancellous bones and joint surfaces are preserved. In the rib cage the manubrium, body and xiphoid process of the sternum are missing and the ribs show multiple fractures.

With the exceptions of the missing left patella, the fragmentary Tl and the sacrum which is broken transversely at the level of the union of S1-S2, the bones inferior to T6 (including T6, are well preserved. The bones of the pelvis and Tl are, however, charred in some areas.

No soft tissue is preserved externally, and neither grease nor the odor of decay persist. No animal teeth marks are apparent.

Assessment Requested: Estimate age at death, sex, race, stature, body type and any relevant information useful for the identification of the remains. Compare findings with information received on John Sullivan, missing person, for a possible match (positive ID).

Summary: The skeletal remains of Case No. 81-8 are assessed as those of a young adult Caucasian male. The age of death is estimated as middle to late twenties, and the living height is estimated as 5' 10 1/2" with a range of a little over 3". Although the skull and several postcranial bones are missing (see Condition of Remains), the excellent condition of the recovered bones permits unqualified, confident assessment. The agreement of all assessments generated by inspectional, osteometric and discriminant function analysis of the available remains of Case No. 81-8 with identification information received on John Sullivan, missing person, supports the positive identification indicated by comparison of antemortem and postmortem x-rays of the left knee. It is also significant that none of our findings suggests a possibility of exclusion.

Method: In order to maintain objectivity in developing assessments from the skeleton of 81-8 for a possible match with information received on John Sullivan, we emphasize osteometric and discriminant function methods in our analysis and in our report. At the same time, it is important that our inspectional analysis corroborates all of the findings achieved with our objective methods.

Age: Primary criteria for age estimation include incomplete fusion of the S1-S2 segments of the sacrum (ending between the late twenties), and evaluation of the metamorphosis of the pubic symphysis according to the method of Mckern and Stewart (late [illegible] age range 23-30, mean age 27.15, standard deviation 3.23). This age estimate of second half of the third decade is supported [illegible]

DECLASSIFIED

[illegible] the ischial ramus.

[illegible] the [illegible] border of the [illegible] the [illegible] formation of the [illegible] contact sheet [illegible] the [illegible] appearance of the other [illegible] test, therefore, traumatic origin.

[illegible] sex are assessed simultaneously by multivariate discriminant function analysis. Our [illegible] variate discriminant function are [illegible] for [illegible] the innominate and femora of American white and [illegible] males and females are selected because [illegible] the skull is missing; (2) the living stature [illegible] of [illegible] or, at about 5' 10 [illegible] perhaps a bit over 5', estimated from maximum length of the right femur [illegible] mm., is so much greater than the mean stature for [illegible] males from El Salvador, 5' 1 1/2" (Handbook of Middle American Indians 1970) that an Indian racial background seems highly improbable; the preserved hair, which is light in color and straight, also suggests a non-Indian and non-Mongoloid classification, leaving Caucasian as the probable racial type. The discriminant function scores, based on eight measurements of the innominate and four from the femur are as follows: discriminant function No. 1 (sex), 1.8981868; function No. 2 (race), 2.7998296; function No. 3, which is also used for our classification, 1.2-Phil. The sex and race [illegible] Nos. 1 and No. 2 for case [illegible] are marked on a scatterplot for [illegible] American white and Black males and females (Fig. 1). The posterior probability of membership in the white male group (Fig. 1, group 1) for this case is .9998.

Race, Morphological Analysis: Observational traits which support the Caucasian classification based on osteometric and multivariate discriminant function analyses include the following: The femoral shaft is bowed and the pilaster or its posterior border is well developed; the epiphyses of the long bones of the lower extremity appear large relative to maximum bone length; vertical height of the ilium (from acetabulum to iliac crest) is large relative to maximum femoral length.

Sex, Morphological Analysis: Observational traits which corroborate the male classification based on osteometric and multivariate discriminant function analyses include the following: the sciatic notch is narrow; the ilium is high, the ischium is long relative to pubic length; the acetabulum is large; the breadth of the [illegible] portion of the [illegible] is great; the body of pubic bone is large and triangular; and the three external male traits of the pubis utilized in the sexing method of the Phenice are clearly male (convexity of the subpubic medial contour; absence of the ventral arc; and sharpness of the inferior border of the medial pubic surface). The long bones, are [illegible] and robust (shaft circumference is great and [illegible] and relative to maximum length) and the epiphyses of the long bones are large; muscle markings are large and prominent.

In summary, the [illegible] [illegible] indicate adaptation for considerable weight [illegible] large [illegible] attachments.

Height: Living stature is estimated from the maximum length of the right femur, [illegible] mm, with the [illegible]

Fragmentary Fabrication Interpretation

The entire [illegible] of the cervical vertebra and all of the thoracic vertebra down to the 8th thoracic vertebra are present, but in two fragments, fractured, fragmentary thoracic vertebrae. The first thoracic vertebra is fractured transversely through the spinous process and through the right and left pedicle leaving a missing segment. The other completion of the [illegible] fractures directed primarily to the anterior and anterolateral aspect of the vertebrae. The manubrium, body and xiphoid process are all missing. The fracture on the right and both clavicles are missing. The left scapula reveals an irregular transverse fracture at the level of the spinous process between the suture and infrascapular area with a small missing fragment. The right humerus, radius and ulna are missing and on the left side, only the trochlea [illegible] of the humerus is present. The distal end is irregularly fractured, but the radius and ulna are missing on the left. Only a [illegible] of the shaft and both ilia are present. The first thoracic vertebra is fragmented and the second [illegible] are present. The third thoracic vertebra is fragmented and the second [illegible] a similar transverse fracture at the point of union at C1-T2. The [illegible] of the other [illegible] vertebrae. [illegible] and the [illegible] [illegible] articulation with cervical [illegible].

These fragments are [illegible] [illegible] [illegible]
